

## **GAIAPRENE NOH-94**

Environmentally responsible medical and Protective Gear is now available.

Currently most cushioned protective gear is made from neoprene, a heavy Halogen based synthetic rubber. Environmental concerns have brought to the light the devastating effects of Halogen on the environment. Europe also has introduced RoHS regulations to combat the environmental effects of heavy metal products. Today Winboss Industrial, the number one manufacturer of rubber foams in Asia, announced immediate availability of the **Environmentally friendly GAIAPRENE** foam.

Neoprene has a variety of properties that make it quite useful, including being abrasion-resistant, chemical-resistant, waterproof, somewhat stretchable and buoyant.

**GAIAPRENE** is not only eco-friendly, it has superior durability and performance.

**GAIAPRENE** is a newly developed product. Addressing the growing concern for the environment, it is designed especially for replacement of neoprene in many fields of application. It does not use CFC's/HCFC's, ozone depleting materials. This Halogen, PVC and Phthalate ester free compound meets RoHS regulations.

In medical uses, where odor is important, **GAIAPRENE** offer an alternative that will not smell like the rubbery odor of neoprene. With superior durability, it can withstand the rigors of the medical environment better than its counterpart.

In flotation applications, **GAIAPRENE** has better thermal insulation than neoprene. It also has much better strength properties, elongation's performance, low water absorption, and low compression set.

**GAIAPRENE** products are chemical resistant, including petroleum products. By resisting fungus and humidity, weather, heat and cold, they can go anywhere.

**GAIAPRENE** products are better for the environment and better for you!

Winboss, and  **GAIAPRENE** are either registered trademarks or trademarks of Winboss Industrial in the United States and/or other countries.
